

Waste Management with Liesegang!

From a legal perspective, the proper disposal of building waste is the responsibility of the person who has produced it, i.e. the client/property owner. The right choice of waste manager and authorised disposal routes for the various types of waste are therefore also the responsibility of the client. The choice of a specialist company gives the client the security of proper and professional handling of the volumes for disposal.

At Liesegang, we are certified as a specialised waste management company in accordance with EfBV for the collection and transportation of numerous types of waste (see our certificate). We are also regularly audited by independent certifiers and authorities.

As a company operating nationwide, we are familiar with the existing disposal routes and partners in nearly all areas of Germany that are either also specialised waste management companies or whose activity is audited by us. In all cases, we provide our customers with the necessary, reliable waste disposal. Due to a lack of permits, within Europe and outside Germany, we use reliable, national waste management companies.

Likewise, with our mobile breaker and sieving plants, we are able to process mineral demolition materials on site in accordance with the specific customer requirements and to install these directly as fill material. Naturally, if required, this is carried out with appropriate quality control.
